                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            26 LeuServalLysPheGlyvalLeuPheArgAspAspLysCysAlaAsnLeuPheGluAla
US-08-812-025-8/C

1US-08-812-025-8/C

Sequence 08, Application US/08812025

Patent No. 5804184

GENERAL INPORMATION:

TITLE OF INVENTION: Transgenic pathogen-resistant organism
TITLE OF INVENTION: Transgenic pathogen-resistant organism
TUTLE OF INVENTION: Transgenic pathogen-resistant organism
NUMBER OF SEQUENCES:

ADDRESSEE: Brumbaugh, Graves, Donohue and Raymond
STREET: 30 Rockefeller Plaza
CITY: New York
COMPTRY: U.S.A.

ZIP: 10112

COMPUTER READABLE FORM:
MEDIUM TYPE: Elopy disk
COMPUTER: IBM PC Compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOCTWARE: Patentin Release #1.0, Version #1.25 (EPO)
CURRENT APPLICATION NUMBER: US/08/912,025

FILING DATE:
REGISTRATION NUMBER: 35,225

It currently consists of 5 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

con Jul 4, 2001 this sequence version replaced gi:14252463.

During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
rogether with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
one plasmid subclone or more than one Mis subclone; and the
assembly was confirmed by reserviction digest. The following
abbreviations are used to associate primary accession numbers given
in the feature table with their source databases: Em: SMISSPROT; Tr:, TREMBL; Wp:, WORMEPP: Information on the WORWEPP
Httn://www.sanger.ac.uk/Drone/Alanata/wormen mit or controled.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger Cettre Chromosome 6 Mapping Group. Further information can be found at http://www.sanger.ac.uk/Hgpt/Chr6
RPII-501Ki4 is from the library RPCI-II.2 constructed by the group of Pieter de Jong. For further details see http://www.chori.org/bacpac/home.htm

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           IMPORTANT: This sequence is not the entire insert of clone RP11-501K14 It may be shorter because we sequence overlapping sections only once, except for a 100 base overlap. The true left end of clone RP11-501K14 is at 1 in this sequence. The true left end of clone RP1-225E12 is at 98297 in this sequence. The true right end of clone RP1-94L3 is at 97304 in this sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    90. .265

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Description

```
ABQS6106 to ABQ60187 represent isolated nucleic acids (1) differentially expressed in cancer tissues. ABBT8993 to ABBT8004 represent proteins encoded by the ABQ60776 to ABQ60787 nucleic acid sequences. (I) can be used in antisense therapy. An antibody immunoreactive with a polypeptide encoded by (I) is useful for detecting cancer in a patient sample, and for detecting the presence or absence of a polymucleotide encoded by a nucleic acid which hybridises to (I) in a cell. A probe/primer derived from the used for determining the presence of a nucleic acid which hybridises to (I), and for determining the phenotype of calls in a sample of cells from a patient. (I) is useful for determining the presence of scale other type of cancer, in antisense therapy, to generate macroarrays on a solid surface, to identify a chromosome on which the corresponding gene resides, and in tissue profilling, forensics, genetic analysis, mapping and diagnostic applications. (I) can be used to raise antibodies, and to screen for peptide analogues and antagonists
tissue type, and in antisense therapy.
                                                                                                      Claim 1; Fig 1; 796pp; English

```
The invention relates to the isolation of genes AAC66410-C66458 encoding 49 human secreted proteins AAB32002-B32050. The genes can be used to generate fusion proteins by linking to the gene for the human compared to the human protein as compared to the human protein only. The genes and tission proteins are useful for preventing, ameliorating or treating medical proteins are useful for preventing, ameliorating or treating medical proteins are useful for preventing, ameliorating or treating medical arange of human tissues disclosed in the specification. The nucleic arange of human tissues disclosed in the specification. The nucleic adagnosis, treatment and prevention of: (a) cancer, e.g. breast and cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital, (b) marrow, breast, gastrointestinal tract, liver, lung, or urogenital, (b) anamemia, autoimmune thyroiditis, disbetes mellitus, crohn's disease, anamemia, autoimmune thyroiditis, disbetes mellitus, crohn's disease, multiple sclerosis, theumacoid arthritis and ulcerative collitis, (d) multiple sclerosis, theumacoid arthritis and ulcerative collitis, (d) cardiovascular disorders such as myocardial ischaemias; (d) wound healing (c) infectious diseases such as viral, bacterial, fungal and parasitic
                                                                                                                                                                                                                                                            Nucleic acid molecules encoding human secreted proteins, used in preventing, treating or ameliorating a disorder, e.g. Alzheimer's and Parkinson's diseases and cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      BP; 241 A; 121 C; 149 G; 201 T; 0 U; 0 Other;

Prostate cancer associated gene sequences, referred to as prostate cancer antigens, useful for treatment, prevention, and diagnosis of disorders such as prostate cancer.

Claim 1; Page 1004-1005; 2338pp; English

AAFISSES to AAFISSOS encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AABSG363 to AABS7302. The prostate cancer antigens can have neuroprotective, cyrostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, graaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polymucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. AAFISSOS to AAFISSOS AABST303 represent sequences used in the exemplification of the present

The invention relates to novel isolated nucleic acids which encode a rat or human Progression Suppressed Gene 13 (PSGen 13) protein. The mucleic acids are useful for preventing the growth of cancer cells and/or new blood vessels, and for treating patients suffering from a cancer. e.g. nasopharyngeal tumour, thyroid tumour, leukaemia, lymphoma, or cancer of the breast, lung, prostate, ovary or colon. PSGen 13 may also be used to suppress the transformed phenotype of a malignant cell. Administration of PSGen 13 gene or protein may result in a decrease in tumour mass, number of cancer cells, serum tumour marker, tumour metastasis, vascularisation, perfusion, or rate of tumour growth, improved clinical symptoms, and/or increased patient survival. The present sequence represents the coding sequence of human Progression Suppressed Gene 13 (HuPSGen 13) Human, Progression Suppressed Gene 13; rPSGen 13; cytostatic; cancer; blood vessel; nasopharyngeal tumour; thyroid tumour; leukaemia; lymphoma; breast; lung; prostate; ovary; colon; gene; ss. 365 246 AATGCTGATGGAAAGTTAAGCGTGAAATTTGGGGTCCTCTTCCGTGATGATAAATGTGCC 305 09 61 TyrProGlyGluLeuLeuLeuGlnGlyValHisAspAspValAspIleIleLeuLeuGln AsnLeuPheGluAlaLeuValGlyThrLeuLysAlaAlaLysArgArgLysIleValThr New rat and human Progression Suppressed Gene 13 for preventing the growth of cancer cells and/or new blood vessels, and for treating patients suffering from a cancer. /\*tag= a /product= "Progression suppressed gene 13 protein" Human Progression Suppressed Gene 13 (HuPSGen 13), cDNA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ABQ56306 to ABQ60787 represent isolated nucleic acids (I) differentially expressed in cancer tissues. ABB7893 to ABB79004 represent proteins encoded by the ABG60776 to ABQ60787 nucleic acid sequences. (I) can be used in antisense therapy. An antibody immunoraactive with a polypeptide encoded by (I) is useful for detecting cancer in a patient sample, and for detecting the presence or absence of a polymucleotide encoded by a nucleic acid which hybridises to (I). A probe/primer derived from (I) can be used for determining the presence of a nucleic acid which hybridises to (I), and for determining the phenotype of cells in a sample

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          80
of cells from a patient. (I) is useful for determining the presence of colon cancer in a cell or tissue type, for determining the presence or state of other type of cancer, in antisense therapy, to generate macroarrays on a solid surface, to identify a chromosome on which the arresponding gene resides, and in tissue profilling, forensics, genetic analysis, mapping and diagnostic applications. (I) can be used to raise antibodies, and to screen for peptide analogues and antagonists
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid that is differentially expressed in cancer tissues useful for determining the presence of colon cancer in a cell tissue type, and in antisense therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TyrProglyGluLeuLeuLeuGlnGlyValHisAspAspValAspIleIleLeuLeuGln

ABQ56306 to ABQ60787 represent isolated nucleic acids (I) differentially expressed in cancer tissues. ABB78931 to ABB7804 represent proteins encoded by the ABG60776 to ABG60787 nucleic acid sequences. (I) can be used in antisense therapy. An antibody immunoreactive with a polypeptide encoded by (I) is useful for detecting and statent sample, and for detecting the presence or absence of a polymucleotide encoded by a nucleic acid which hybridises to (I) in a cell. A probe/primer derived from (I) can be used for determining the presence of a nucleic acid which hybridises to (I) in a cell. A probe/primer derived from (I) can be used for determining the phenotype of cells in a sample of cells from a patient. (I) is useful for determining the presence or state of other type of cancer, in antisense therapy, to generate macroarrays on a solid surface, to identify a chromosome on which the corresponding gene resides, and in tissue profiling, forensics, genetic analysis, mapping and diagnostic applications. (I) can be used to raise antibodies, and antagonists

The invention relates to novel isolated nucleic acids which encode a rat or human progression Suppressed Gene 13 (PSGen 13) protein. The nucleic acids are useful for preventing the growth of cancer cells and/or new blood vessels, and for treating patients suffering from a cancer. e.g. nasopharyngeal tumour, thyroid tumour, leukaemia, lymphoma, or cancer of suppress the transformed phenotype of a malignant cell. Administration of PSGen 13 gene or protein may result in a decrease in tumour mass, number of cancer cells, serum tumour mersher, tumour mersateasis, vascularisation, perfusion, or rate of tumour growth, improved clinical symptoms, and/or increased patient survival. The present sequence represents the coding sequence of rat Progression Suppressed Gene 13 (rPSGen 13)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 TyrProGlyGluLeuLeuGlnGlyValHisAspAspValAspIleIleLeuGln

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated polynuclectide comprising any one of 38043 cDNA sequences, appearing as Aril2789-ARH5081. whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynuclectide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for infernsics, in assessing bloidiversities, or in identifying mutations, responsible for generic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, for Chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antisense DNA or RNA. The purified polypeptide is useful for generating antisense by sequences. Note: The greence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                       New polynucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      291 AATGCTGATGGAAAGTTAAGCGTGAAATTTGGGGTCCTCTTCCGTGATGATAATGTGCC 350

The present invention relates to methods of diagnosing breast cancer in a patient, which comprise detecting the level of expression in a tissue sample of two or more genes selected from those shown in ABT09867.

STILLI2, where a differential expression of the genes indicates breast cancer. The methods are useful in diagnosing, treating, detecting the progression, and in monitoring treatment of breast cancer in patients.

The methods are also useful as a screening tool for agents that modulate the onset or progression of breast cancer. The breast cancer genes may be the onset or progression of breast cancer. The breast cancer genes may be useful or progression of breast for the prediction or identification of the malignant state of breast tissue, for confirming the type and progression of cancer, and for drug screening and assays. The present sequence is a coding sequence of the printed specification, but was obtained in electronic format directly from WHOO at the printed pot from the printed pot from the printed profrage sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               21 AsnalaaspGlyLysLeuSerValLysPheGlyValLeuPheargAspAspLysCysAla 40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Diagnosing breast cancer in a patient comprises detecting the level c
gene expression in cell or tissue samples, where a differential gene
expression is indicative of breast cancer.

This gene has suppressed expression in progressed tumour cells. PSGen13 was identified using new methods for identifying nucleic acids differentially expressed between two samples. The method involves performing reciprocal subtraction differential RNA display (RSDD) between the two samples to generate two subtraction samples. The subtraction samples to and compared to identify those nucleic acids that are differentially expressed. The method is used to identify and clone differentially expressed genes, particularly those with increased or reduced expression and progressed genes (PSGen) and progressed genes (PSGen). The method reduces the complexity of the band pattern produced in conventional differential RNA display (where bands may be obscured, resulting in false positive signals) since most bands common to both samples are eliminated, allowing identification and cloning of genes displaying anticipated differential expression. RSDD

```
The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid arrepresentative of expressed polynucleotides in the plant cell with an array or profile of expressed polynucleotides in the plant cell with an detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ1219-6-ABZ17574) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             258
Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                genetically modified organism; transgenic organism; plant;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   25-MAY-1999
                                                                                                                                                                                                                                                                                                                                                                              06-SEP-2000
                                                                                                                                                                          AAC53673;
                                                                                                                    RESULT 14
                                                                                                                                  AAC53673
                                                                                                                                              The invention describes a nucleic acid (I) comprising a sequence capable of hybridising under stringent conditions to any one of 999 fully defined Arabidopsis thaliana sequences (I) as given in specification e.g., 360, 1137, 455, 2199, 472 nucleotides, etc., or tis fragment. (I) is useful as a hybridisation probe to complementary molecules in a cDNA library. (I) is also useful for generating genetically modified and transgenic organisms, usually plant cells and plants. A proten encoded by (I) is useful in screening assays to determine the effect of candidate inhibitors, activators or modifiers of the gene product. The protein is also useful for screening biologically active agents e.g., fungicides and insecticides. A genetically modified cell, comprising an exogenous insecticides. A genetically modified cell, comprising an exogenous sequences operably linked to a sequence capable of hybridising under stringent conditions to (I) is useful in the study of genetic function and regulation, for alteration of the cellular metabolism and for screening compounds that may affect the biological function of the gene or gene product. This sequence represents an Arabidopsis thaliana polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     21 AsnAlaAspGlyLysLeuSerValLysPheGlyValLeuPheArgAspAspLysCysAla 40

```

The invention relates to polynucleotides encoding colon tumour proteins. The polynucleotides and encoded polypeptides are useful in pharmaceutical compositions, such as vaccines, for the diagnosis, prevention, and treatment of colon cancer. Polynucleotide sequences may be used as hybridisation probes or primers, and in the design and preparation of ribozyme molecules for inhibiting expression of tumour polypeptides and proteins in tumour cells. The compositions are useful for stimulating an immune response against cancer, particularly for the immunotherapy of colon cancer, and as markers for the progression of cancer. ABK4450-610n and an accent coding sequences of human colon tumour proteins of the invention. Note: With the exception of SEQ ID No 1 and 2, the sequence data for this parent did not form part of the printed specification but was supplied by the Buropean Patent Office

Claim 1; SEQ ID NO 939; 147pp; English.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr6 RPII-501K14 is from the library RPCI-II.2 constructed by the group of Pieter de Jong. For further details see http://www.chori.org/bacpac/home.htm

VECTOR: pBACc3.6
IMPORTANT: This sequence is not the entire insert of clone RPII-501K14 It may be shorter because we sequence overlapping sections only once, except for a 100 base overlap.

The true left end of clone RPII-505K14 is at 1 in this sequence. The true left end of clone RPII-525E12 is at 98297 in this sequence.

The true left end of clone RPII-94L3 is at 97304 in this sequence.
where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORWHEP; Information on the WORWHEP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   note="MER47 repeat: matches 2242. .2323 of consensus"
